FINAL REPORT FOR INDUSTRIAL ATTACHMENT AT

BE U DIGITAL BANK by BANK ISLAM

11 AUGUST 2025 – 11 FEBRUARY 2026

ENGKU AMIRUL HAKEEM BIN
ENGKU MOHAMAD FADZRUL

2121807

BACHELOR OF INFORMATION TECHNOLOGY

SEMESTER 3 , 2025/2026

SUPERVISED BY

NORASIKIN ABDUL WAHAB

DR. NAJHAN BIN MUHAMAD IBRAHIM

ACKNOWLEDGEMENT

I would like to express **my heartfelt gratitude and appreciation** to all those who have contributed to the successful completion of my internship and this internship report at **BE U Digital Bank, Bank Islam Malaysia Berhad**. The internship offered meaningful exposure to the financial services industry, where business intelligence and analytics played an important role in supporting digital banking operations and financial decision-making.

First and foremost, I would like to express my heartfelt gratitude to **Ms. Norasikin Abdul Wahab, my internship supervisor**, for her continuous guidance and encouragement throughout my internship. I am truly thankful for her willingness to share her knowledge and real-world experience which helped me better understand digital banking operations , automation processes, and the role of data in supporting decision-making within a regulated financial institution. Beyond technical skills, she also inspired me to stay curious and to keep learning, reminding me that growth comes from asking questions and continuously improving. I deeply appreciate her support and the valuable lessons she has shared with me.

I would also like to express my sincere appreciation to the **Operational Excellence Team** for their warm welcome, guidance, and support throughout my internship. I am especially grateful to my **Team Leader, Ms Shariha Roseley**, whose experience in the banking industry taught me the importance of balancing hard work with composure and proper planning, and who always treated us with respect and kindness. I would also like to thank **Mr. Syed Azryl, Head of Digital Operations**, for his calm and approachable leadership and for being open to suggestions, which created a supportive environment for learning. I am thankful to my **internship partner, Afif**, who worked alongside me from day one, as well **as Syahirah, Liyan, Syafiq, and all members of the Digital Operations and CDX teams** for their assistance and collaboration. This experience allowed me to gain valuable hands-on exposure to digital banking workflows, data handling, and cross-department collaboration, strengthening my technical and analytical skills.

Furthermore, I am deeply grateful to **my academic supervisor, Dr. Najhan Ibrahim**, and **IAP Coordinators, Dr. Ayub and Dr. Liyana**, for their continuous guidance, constructive feedback, and encouragement throughout my internship. Their support in monitoring my progress and reviewing my reports helped ensure a meaningful and structured learning experience. I would also like to thank **my family and friends** for their encouragement and motivation, which helped me remain focused and committed. Finally, I am **sincerely thankful to everyone who contributed to my learning and professional development during this internship**, as the experience strengthened my understanding of digital banking and reconciliation processes while equipping me with valuable skills and professional discipline for my future career in the banking and financial services industry.

Sincerely,
Engku Hakeem
Date: 10 February 2026

DECLARATION

I hereby declare that I carried out the work presented in this report while working for **Be U Digital Bank by Bank Islam** and under the supervision of **Ms Norasikin binti Abdul Wahab** I solemnly declare that to the best of my knowledge, NO part of this report contains any sensitive or false data of the company. All contents in this report have been verified by my supervisor and approved for submission to the **Department of Information Technology** in partial fulfillment of the requirements for the degree of **Bachelor of Information Technology.**

1. INTRODUCTION

1.1. Company Background

Figure 1 : Bank Islam Malaysia Berhad Logo

Bank Islam Malaysia Berhad

Founded in 1983, **Bank Islam Malaysia Berhad (BIMB)** is **Malaysia's first Islamic bank**, offering a comprehensive range of financial products and services based on Shariah principles. The bank serves as a benchmark for ethical and inclusive financial services, balancing innovation with Islamic values.

Headquartered at **Menara Bank Islam, Jalan Perak, Kuala Lumpur**, the bank operates more than 135 branches nationwide and employs approximately 4,500 staff. Over the years, Bank Islam has continued to strengthen its digital capabilities, operational efficiency, and customer-centric services in line with the evolving financial landscape.

Figure 2 : BE U Digital Bank Logo

BE U Digital Bank

BE U Digital Bank is Bank Islam's digital banking platform, developed to provide **end-to-end banking services through mobile and digital channels**. The platform focuses on digital onboarding, cashless transactions, and savings features, supporting Bank Islam's financial inclusion agenda.

Organizationally, BE U was previously under the **Group Digital division**. Beginning in 2026, its operations were aligned under the **Group Retail Banking** division to further integrate digital services with core retail banking operations and expand customer reach

1.2. Department Background

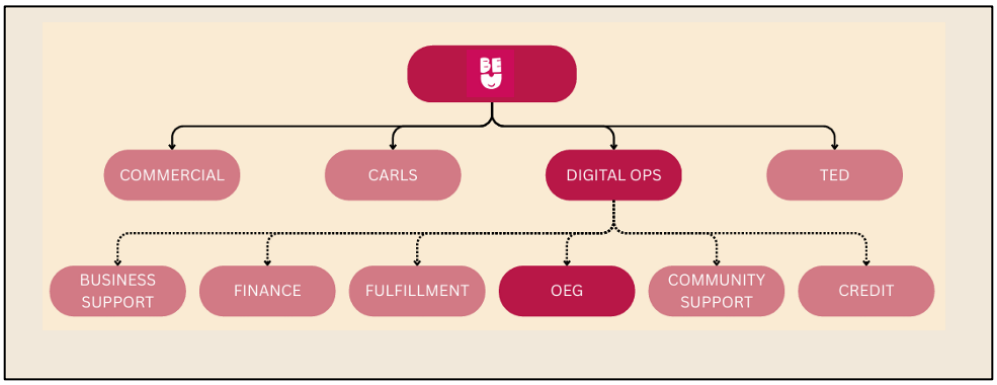

Figure 3 : Department Structure of BE U Digital Bank

During my internship, I was placed in the **Operational Excellence and Governance (OEG) team** under the Digital Operations (DO) division at BE U Digital Bank, Bank Islam Malaysia Berhad. As shown in Figure 3, the Digital Operations division consists of several functional teams that support different aspects of digital banking services, with the OEG team focusing on operational readiness, governance, and continuous improvement initiatives to ensure efficient and reliable operations.

The Operational Excellence and Governance team plays an important role in **ensuring the operational feasibility of proposed features before implementation**, supporting smooth handovers from project or development phases to daily operations, and aligning solutions with compliance and governance requirements. In addition, the team is responsible for maintaining and updating standard operating procedures (SOPs), supporting internal initiatives, and identifying opportunities for process improvement to enhance operational efficiency and service quality. The team also collaborates closely with other units within Digital Operations and cross-functional departments to ensure that workflows, controls, and reporting processes run effectively in a regulated banking environment.

In this role, I served as a **Dashboard and Automation Intern**, where I assisted in data handling, dashboard preparation, and automation-related tasks that supported operational monitoring and reporting activities.. This role provided valuable exposure to real-world digital banking workflows and strengthened my technical, analytical, and problem-solving skills, while also helping me develop greater attention to detail and professional discipline in a fast-paced working environment.

2. PROJECT DESCRIPTION

2.1. Introduction of the project

Project Category	Project Name	Duration
Dashboard	OEG Operational Dashboard	11/8/2025 – 11/2/2026
Dashboard	Business Support Dashboard	23/9/2025 – 11/2/2026
Automation	DuitNow Reconciliation	25/8/2025 –10/10/2026
Automation	Procurement Request	23/9/2025 –31/12/2025
Automation	My Debit Reconciliation	3/11/2025 –28/11/2026
Automation	RPP Settlement	15/12/2025 –31/2/2026
Automation	NTB/ETB Reporting	12/1/2026 –11/2/2026

Table 1 : Summary of Major Projects

During my internship at BE U Digital Bank under the Operational Excellence and Governance (OEG) team, I was assigned several projects related to **operational dashboard development** and **process improvement through automation**. These projects were carried out to support operational monitoring, improve reporting efficiency, and reduce manual processing time within the Digital Operations division. A summary of the major projects undertaken during the internship is presented in Table 1.

The **dashboard-related projects** involved developing operational dashboards used to monitor initiatives, procurement activities, memo registers, and other operational metrics. The work typically followed a structured workflow that included requirement gathering, defining metrics and KPIs, data cleaning and preparation, dashboard design, development, validation, and deployment.

In addition, I was involved in several **automation and process improvement initiatives** aimed at streamlining reconciliation, tracking, and reporting processes. These projects began with documenting the As-Is process to understand the existing workflow, followed by designing the To-Be process to improve efficiency and reduce manual effort. Requirement gathering was conducted with business users to define automation logic, desired outputs, and data sources. The automation solutions were subsequently developed and tested through User Acceptance Testing (UAT), followed by documentation and sign-off to ensure proper handover and sustainability of the solutions in daily operations.

2.2. Tasks Description

2.2.1 Operational Excellence and Governance (OEG) Team Dashboard

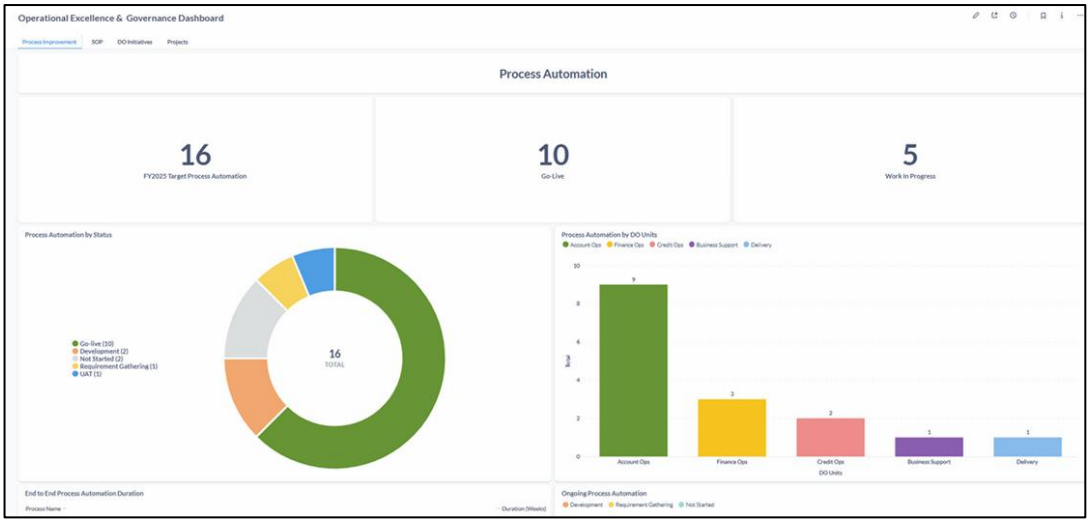

Figure 4 : Process Improvement Tab in OEG Dashboard

For the **OEG Team Dashboard**, my tasks began with **requirement gathering** sessions to determine the metrics to be displayed, the types of graphs required, colour selections, and the layout of charts. The dashboard consisted of four main tabs: Process Improvement, SOP, Digital Initiatives, and Projects, each supported by its own master dataset.

The dashboard was developed using **Metabase**. As part of the preparation process, I performed **data cleaning** and calculations using Microsoft Excel, including formulas to calculate durations in working days. I also used **SQL** queries in Metabase to customize visualizations, including sorting, grouping, and filtering to ensure the charts reflected the required business logic.

During development, progress review meetings were conducted as part of an **agile** approach, allowing stakeholders to provide feedback and request changes. After development, **User Acceptance Testing (UAT)** was carried out with the OEG Team and the Head of Digital Operations to validate accuracy and usability.

Once approved, the dashboard was migrated from the **development environment to production**. Final adjustments were performed before the dashboard was ready for use. I also assisted in knowledge transfer sessions, organizing the data structure and preparing guidance on the dashboard data update process to support smooth handover.

2.2.2 Business Support Team Dashboard

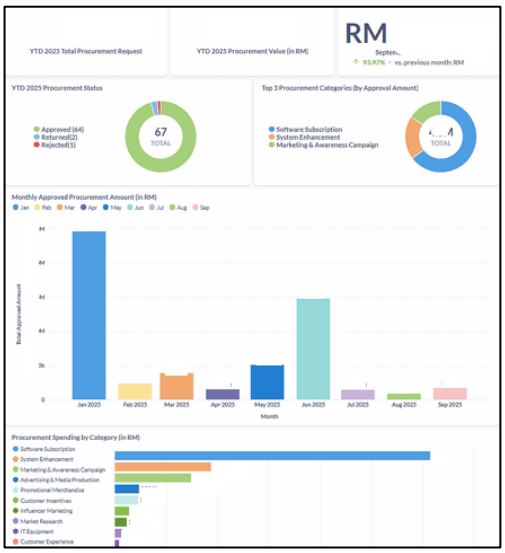

Figure 5:Procurement Tab

Figure 6: Memo Register Tab

The **Business Support Team Dashboard** was developed using a workflow similar to the OEG Dashboard, following stages such as requirement gathering, data preparation, development, validation, and deployment. The dashboard consisted of four main tabs: Procurement, Memo Register, Headcount, and Contract. My responsibilities focused mainly on the **Procurement and Memo Register** tabs, while the Headcount and Contract tabs were handled by my internship partner.

For the Procurement tab, the dashboard was designed to provide an overview of total procurement requests and values, with **breakdowns by month and by category** to support monitoring and reporting. Data cleaning and preparation were carried out before uploading the datasets into Metabase to ensure accuracy and consistency of the visualizations.

For the Memo Register tab, the dashboard displayed key metrics such as the **total number of memos, rejected or cancelled records, and monthly summaries**. Additional visualizations were created to show distributions by unit, by category, and by month, enabling the team to monitor trends and reporting status more effectively.

Throughout development, discussions and progress reviews were conducted with the Business Support Team to ensure the dashboard met reporting needs. User Acceptance Testing (UAT) was then performed to validate accuracy and usability, followed by final adjustments and preparation of documentation for future updates.

2.2.3 DUITNOW Reconciliation Automation

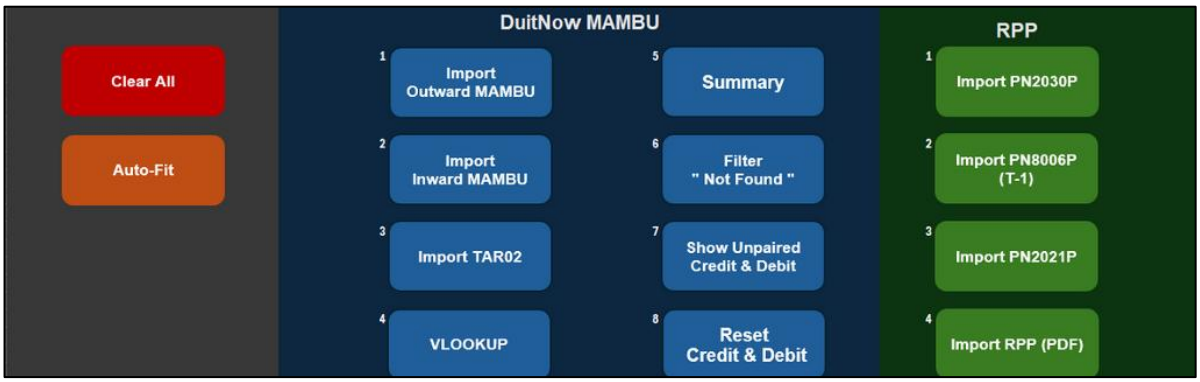

Figure 7 : DUITNOW Reconcilliation Automation Interface

For the **DuitNow Mambu 2.0 Automation** project, I was involved in requirement gathering, development support, testing, and documentation of the **reconciliation process between Mambu transaction reports and TAR02 files from PayNet**. The objective of this automation was to streamline the daily reconciliation workflow for the GL Operations team by reducing manual matching, improving accuracy, and speeding up reporting.

A key challenge in this project was **handling large datasets**, as the combined Mambu and TAR02 files could contain between 1 to 2 million rows of data, which exceeds the row limit of Microsoft Excel. To address this, **Power Query** was used to extract, split, and transform the datasets efficiently. Data cleaning and validation were performed, including filtering relevant transaction codes, standardizing formats, and ensuring consistency before reconciliation and summarization.

In addition, I assisted in implementing and testing automation logic using Excel formulas and **Macro VBA t**o support tasks such as importing files, performing lookups, highlighting unmatched or duplicate records, summarizing credit and debit values, and filtering exceptions for further investigation. Requirement discussions and progress reviews were conducted with users throughout the development process, followed by User Acceptance Testing (UAT) to validate the accuracy and usability of the automation before deployment. I also supported documentation and minor enhancements to ensure the solution could be maintained and used effectively in daily operations.

2.2.4 Procurement Request Automation

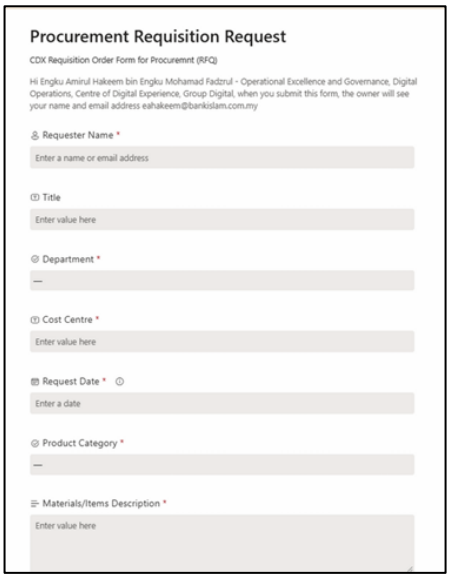

Figure 8 : Microsoft List Digital Form

Figure 9 : Power Automate Flow

The **Procurement Request Automation** project was developed for the Business Support Team to improve the existing request process. Previously, procurement requests were submitted using Microsoft Word forms via email, and the team had to manually review Outlook to verify budget details and approvals. Due to the high volume of emails received daily, there was a risk of delays or missed requests. To address this issue, a **digital form** was created using Microsoft Lists (Figure 8) and integrated with a **Power Automate workflow** (Figure 9). The flow automatically stored submissions in a SharePoint list (Figure 10) and sent email notifications, improving tracking, visibility, and overall efficiency.

Figure 10 : Sharepoint Listing for Procurement Request

Figure 10 shows the **SharePoint list** used to store procurement request data, including title, status, value, and product category. The data can be displayed in different formats such as list, board, and calendar views to support tracking and monitoring.

2.2.5 MYDEBIT Reconciliation Automation

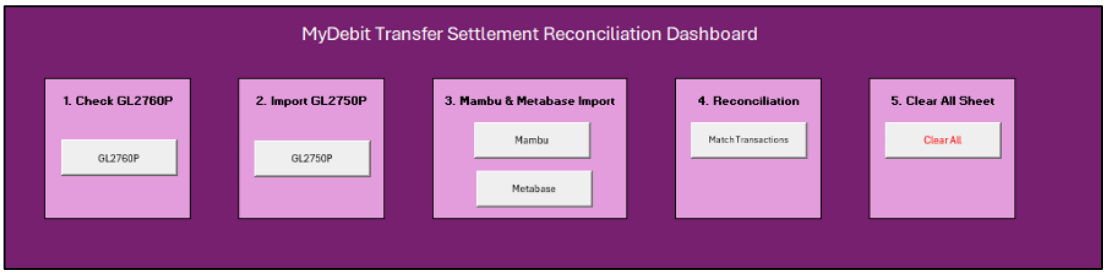

Figure 11 : MyDebit Transfer Reconciliation Automation Interface

For the **MyDebit Reconciliation Automation** project, the process involved matching transactions from four data sources: GL2760P, GL2750P, Mambu export files, and Metabase debit card data. A key challenge was that the GL files contained multiple-line record formats. The cleaning process included restructuring records, removing unnecessary headers, standardizing formats, consolidating multi-line transactions, and validating debit and credit values before matching.Due to the file structure**, Python** was used instead of VBA or Power Query, as it handled parsing and transformation more efficiently. I also assisted in User Acceptance Testing (UAT) and helped set up the Python integration environment on the GL team's devices after approval.

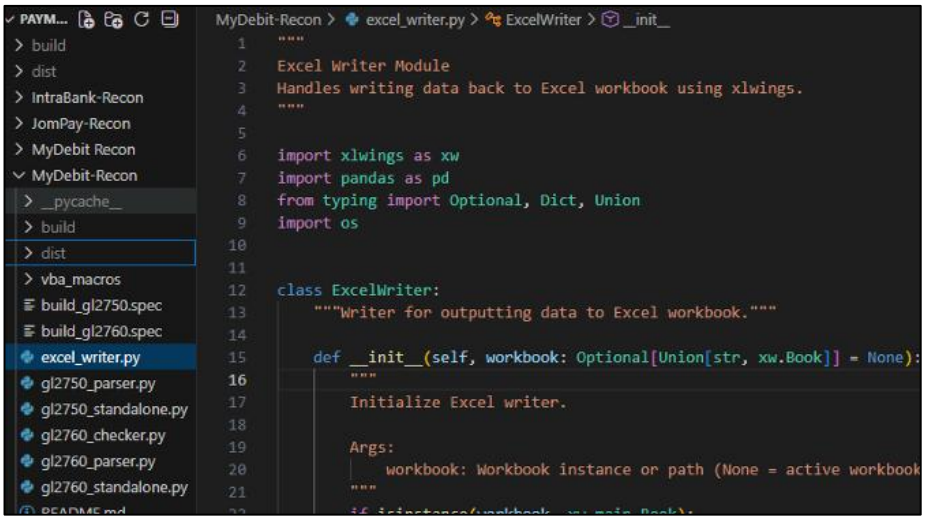

Figure 12 : Vs Code Python Code IDE for MyDebit Automation

Figure 12 shows the **Visual Studio Code (VS Code)** environment used to develop the Python scripts for the MyDebit Reconciliation Automation. The project folders and modules for processing GL files and exporting cleaned data to Excel using libraries such as pandas and xlwings are displayed.

2.2.6 RPP Settlement Automation

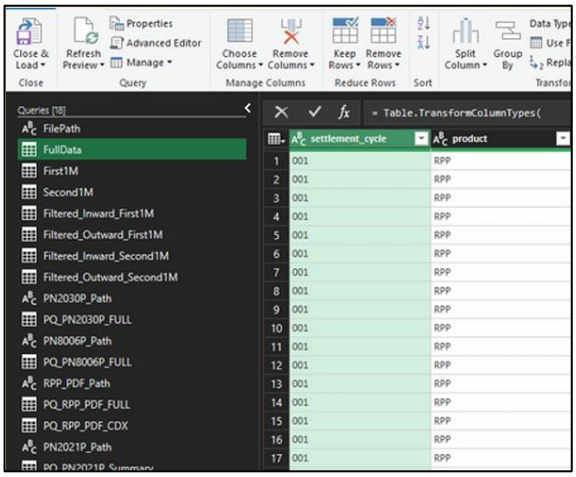

Figure 13 : Power Query Interface

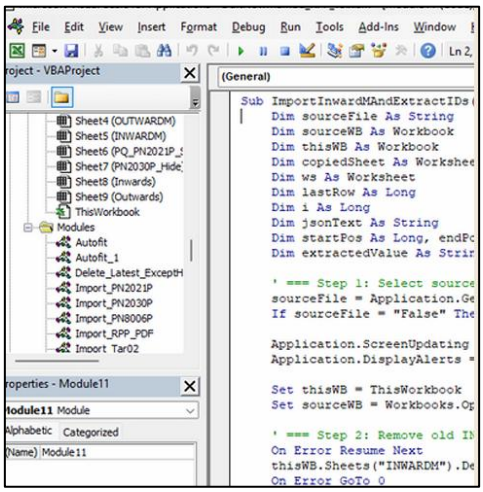

Figure 14 : Macro VBA interface

For the **RPP Settlement Automation project**, this work was a **continuation of the DuitNow reconciliation automation**, focusing on validating settlement balances through **additional cross-checking procedures**. The initiative was developed to assist the GL Operations team in verifying settlement accuracy by comparing results against four additional data sources: PN2030P, PN8006P (T-1), PN2021P, and the RPP Settlement PDF (GLDP IBT). These files were used to validate transaction counts, net settlement totals, inward and outward movements, and corresponding debit and credit values.

Power Query was used to extract, clean, and standardize the data, including formatting amounts, dates, and references, as shown in Figure 13. The tasks also involved **filtering CDX-related transactions, validating totals between sources, and preparing summarized outputs to support daily settlement verification**. After User Acceptance Testing (UAT), a minor enhancement was implemented to address slow Power Query refresh performance and to improve exception handling, particularly in cases where GL source files were empty. This automation improved the efficiency of settlement checks and enabled the GL team to identify discrepancies more quickly while reducing manual effort and improving reporting accuracy.

2.2.7 NTB/ETB Reporting Automation

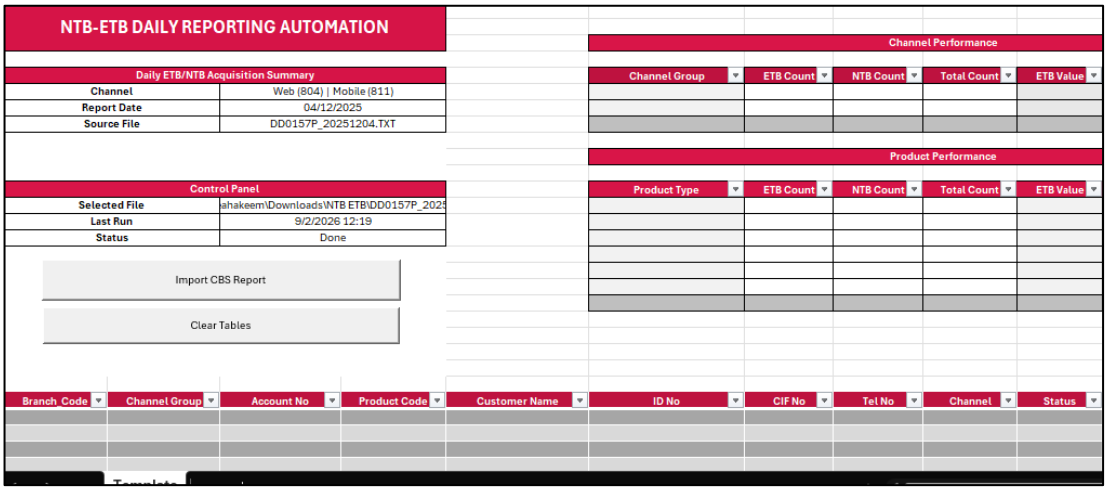

Figure 15 : NTB/ETB Reporting Automation Interface

For the **NTB/ETB Daily Reporting Automation**, this was the first automation project I developed for a team outside the Digital Operations division, specifically supporting a team in the Group Retail Banking division. The purpose of this automation was to generate a daily summary of New-to-Bank (NTB) and Existing-to-Bank (ETB) account acquisitions, including counts and deposit values by channel and product type.

Although the source report initially appeared well formatted and organized, it contained significant data alignment issues and inconsistent structures that required extensive data cleaning in Power Query. The cleaning process involved **restructuring fixed-width text records, filtering valid account rows, standardizing fields, extracting product and customer information, and deriving calculated fields** such as channel grouping and deposit values to prepare the dataset for reporting.

After the initial development, User Acceptance Testing (UAT) was conducted with stakeholders. During testing, an additional requirement was requested to include ETB and NTB deposit values in RM, summarized by channel and product type. This enhancement was **implemented by aggregating deposit values from the cleaned dataset.** The UAT was successfully completed, and stakeholders indicated that future enhancements may include an as-of monthly reporting view for longer-term analysis.

2.2.8 Business Process Documentation

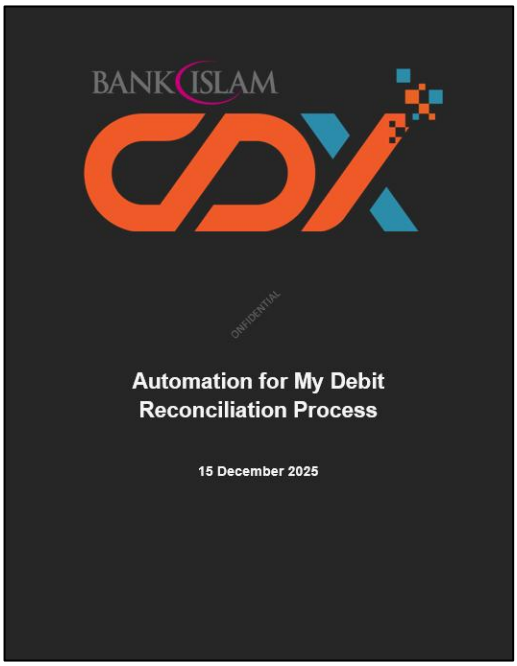

Figure 16 : Process Documentation Cover Page

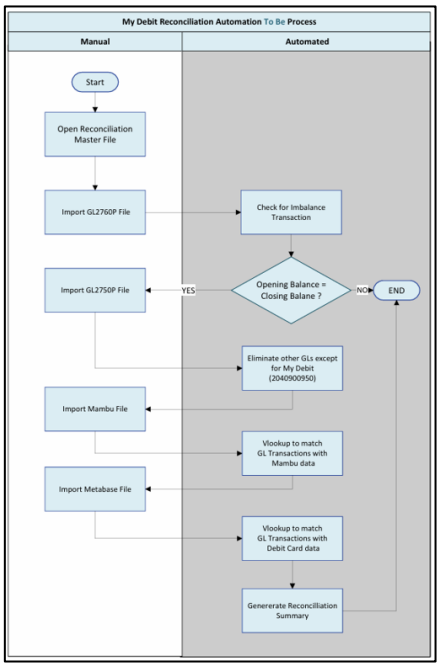

Figure 17 : Automation Flow Diagram

For each project, **business process documentation** was prepared to **ensure clear requirements, validation, and structured sign-off before deployment**. The documentation included sections such as introduction, objectives, scope, and process overview to explain the workflow and purpose of each solution.

I used **Microsoft Visio** to illustrate process flows, including the manual (As-Is) and proposed automated (To-Be) workflows, helping stakeholders visualize changes and confirm requirements. Detailed tables were also prepared to describe each step, including system actions, manual actions, and expected outputs.

The documentation included a **business impact analysis** to evaluate improvements such as reduced processing time, lower manual effort, and better operational visibility. Supporting materials, including code references and appendices, were included to assist maintenance and knowledge transfer. This task strengthened my skills in requirement analysis, process mapping, and documentation, which are important in the role of an IT Business Analyst.

2.2.9 Weekly Team Update Meeting

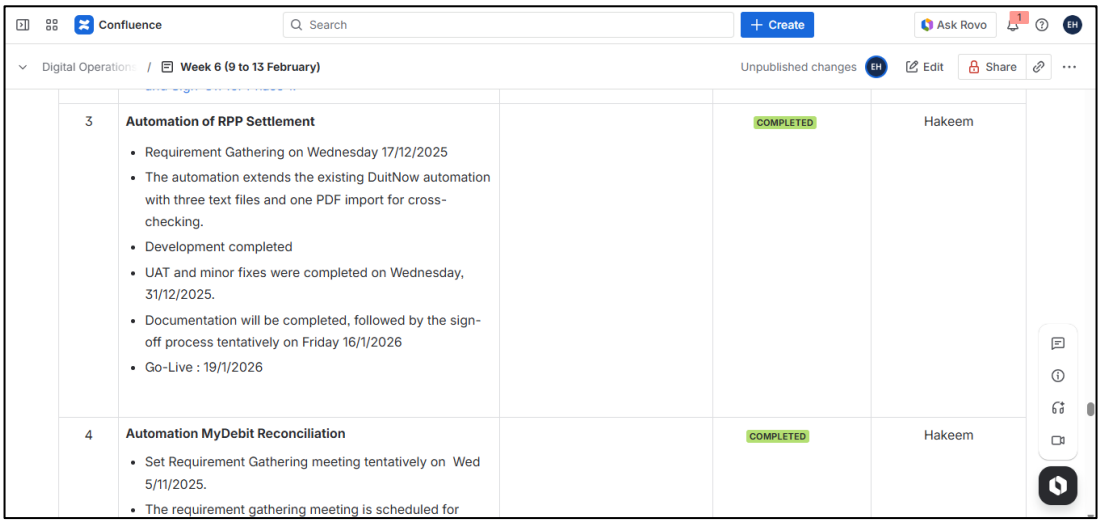

Figure 18 : Confluence Weekly Update

Once a week, the team conducted a **weekly update meeting** with the Operational Excellence and Governance (OEG) Team and the Head of Digital Operations. During these sessions, we presented our **project progress, discussed any issues encountered, and determined the best course of action to address challenges or improve ongoing work**. These meetings helped ensure alignment between team members and stakeholders, while keeping projects on track according to priorities and timelines.

All updates, meeting notes, and progress summaries were documented in **Confluence** to maintain proper records and provide visibility to the wider team.

Through these weekly meetings, I learned the **importance of clear communication**, structured reporting, and proactive problem-solving in a professional environment. The sessions also improved my ability to present technical work in a concise manner, manage feedback, and adapt to changes in project requirements effectively.

2.3. Achievement

a. Dashboard Development and Deployment

Contributed to the development and enhancement of operational dashboards, including the Operational Excellence and Governance (OEG) Dashboard and Business Support Dashboard, covering **8 dashboard tabs**. While the initial metrics and prototype designs were prepared by previous interns, I was responsible for data preparation, visualization refinement, testing, and migration to the production environment. These dashboards are used **to provide quick operational insights for management-level decision-making**. I also assisted in **requirement gathering for the next phase of the Account Operations Dashboard**, involving multiple teams before the end of my internship.

b. Process Automation and Improvement

Contributed to **five automation initiatives** including DuitNow, MyDebit, RPP Settlement, Procurement, and NTB/ETB reporting automation. These solutions helped reduce manual processing time by **up to 60%**, improved reconciliation accuracy, and enhanced exception handling. Several of these automation tools are **used every day by operational teams**, supporting daily reconciliation and reporting activities

c. Data Processing and Integration

Processed and cleaned data from multiple sources, including Mambu exports, TAR02 files, CBS and GL files, Metabase datasets, PDF reports, and test files. The **cleaning process** involved restructuring raw data, removing unnecessary headers and duplicates, standardizing date and number formats, correcting misaligned columns, filtering relevant records, and validating totals to ensure consistency between sources. I also **handled large datasets ranging from hundreds of thousands to over 2 million rows,** using Power Query and other tools to split, transform, and prepare the data for reporting and automation while ensuring accuracy and reliability.

3. LESSON AND EXPERIENCE LEARNT

3.1. Knowledge Gained

a. Understanding of Digital Banking and Dashboard Development

Gained a better **understanding of digital banking operations** and the **role of dashboards in monitoring** daily activities. I learned the importance of **data sensitivity, update frequency, and reliability of information**. From a developer's perspective, I learned to consider what users need to monitor, where the data should be sourced, and what management expects to see for effective decision-making.

b. Importance of Automation in Operations

Developed an understanding of how **automation improves operational efficiency** by reducing manual work, minimizing errors, and enabling faster reconciliation and reporting. I observed how automation supports daily operations and allows teams to focus more on analysis and exception handling.

c. Data Processing and Integration

Learned the **complete project workflow**, from requirement gathering to development, User Acceptance Testing (UAT), documentation, and sign-off. I also gained exposure to real project discussions and operational meetings, which helped me understand how requirements are refined and decisions are made. In addition, I was involved in preparing presentation decks and progress updates, and learned the **importance of planning tasks** using tools such as Gantt charts, communicating updates clearly, and aligning work with team capacity and timelines.

3.2. Skills Gained

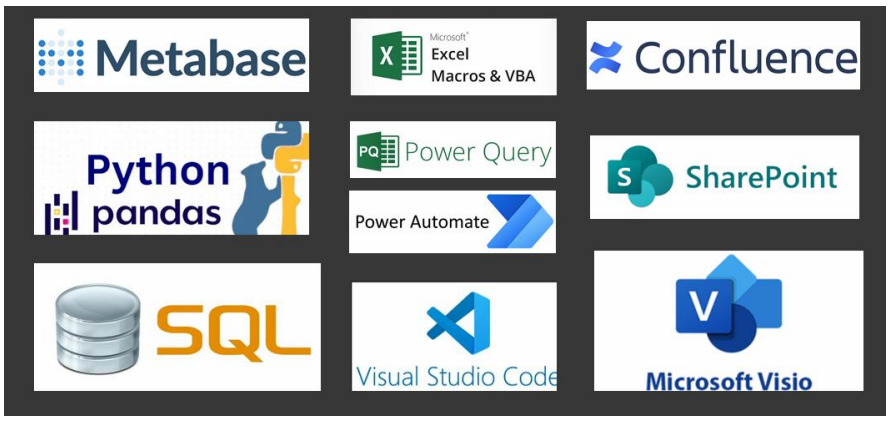

Figure 19 : Tools and Technologies Used During Internship

a. Technical and Tools Skills

Strengthened practical skills in using **various tools and technologies** (as shown in Figure X), including Microsoft Excel, Power Query, VBA, SQL, Python (pandas), Metabase, Power Automate, SharePoint, Visual Studio Code, and Microsoft Visio. These tools were applied in data cleaning, transformation, automation development, dashboard creation, and process documentation. I also gained experience in handling large datasets, integrating data from multiple sources, and validating outputs to ensure accuracy and reliability.

b. Communication and Collaboration Skills

I learned how to **present progress clearly, prepare presentation slides, discuss issues with stakeholders, and collaborate effectively** with team members from different departments to ensure that project requirements were understood and met.

c. Analytical and Problem-Solving Skills

Enhanced analytical and problem-solving abilities **by identifying data inconsistencies, troubleshooting automation and dashboard issues, optimizing workflows, and improving processes to increase efficiency and accuracy**. Working with real operational data and tight timelines strengthened my attention to detail, structured thinking, and ability to approach problems systematically.

3.3. Reflection

During my internship, I realized that **technology is constantly evolving**, especially in the areas of data analytics, automation, and digital banking. This experience taught me that continuous learning and upskilling are not optional but necessary to remain relevant in the industry. This mindset reflects the concept of ***Kaizen*, the Japanese philosophy of continuous improvement**, where small and consistent efforts lead to long-term progress (Investopedia, n.d.). I learned that improvement does not only apply to systems and processes but also to personal growth, knowledge, and discipline. Another important lesson was **the importance of communication**, particularly the ability to explain technical concepts in terms that a layman can easily understand, so that stakeholders from non-technical backgrounds can clearly grasp the purpose and impact of a solution. Effective communication ensures alignment, reduces misunderstanding, and improves teamwork.

I also gained a **clearer understanding of the different professional roles** within projects, particularly the roles of a Business Analyst and a Data Analyst. While both roles share common ground in working with data and supporting decision-making, they require different core skill sets and perspectives. This realization helped me appreciate the importance of collaboration and specialization, while also understanding that these skills can be developed through effort, discipline, and determination. Another key reflection is the **importance of planning and structured execution**, as proper timelines, requirement clarity, and progress tracking significantly influence project success. Lastly, my internship experience also strengthened my appreciation of the **Tawhidic epistemology** concept emphasized at IIUM, which reminds me to seek knowledge with responsibility, integrity, and the intention to contribute positively to society through my work (International Islamic University Malaysia, 2025).

4. CONCLUSION

Overall, my internship experience has been a **valuable and meaningful journey that provided me with practical exposure to real working environments**, particularly in digital banking operations, data processing, dashboard development, and automation projects. The internship **allowed me to apply knowledge gained in university to real-world situations while learning new tools, technologies, and professional practices essential in the industry**. Working on real projects, collaborating with different teams, and contributing to operational improvements strengthened my confidence, discipline, and sense of responsibility in a professional setting. I am grateful for the opportunity to undergo my internship in an environment that encouraged learning and continuous improvement. This experience has given me **a good starting point for my career and motivates me to continue improving myself**, to work smarter, and to strive to become the best version of myself for the sake of Allah SWT and to contribute positively to society and the community.

In addition, there are **several suggestions that could further enhance the internship academic preparation**. One potential improvement is **increasing student exposure to real-world problem-solving environments such as datathons or hackathons**. IIUM could consider organizing its own events and inviting industry professionals to share practical insights. Another suggestion is to place greater emphasis on **strengthening critical thinking skills**, training students to analyze problems, reduce operational pain points, bring value, and make sound decisions under pressure. Lastly, **deeper exposure to Cloud computing and Artificial Intelligence would be beneficial across all majors**, including topics such as cloud infrastructure and emerging areas like agentic AI, supported through collaboration with industry partners for certifications and workshops.

In conclusion, I would like to express my **sincere appreciation and gratitude** to **BE U Digital Bank, Bank Islam Malaysia Berhad**, for providing me with the opportunity to learn and grow in a professional environment, as well as to the **International Islamic University Malaysia (IIUM)** for providing the academic foundation that supported this internship journey.
